SUMMARY

Production operations across systems serving more than 2M users: monitoring and alerting, incident investigation and root cause analysis, release readiness, and SQL and Python automation. Led a three-person technical team while staying hands-on with the systems, pipelines and databases behind production.

SKILLS

Production & Reliability: Production operations, monitoring and alerting, observability, incident response, root cause analysis, release management, release readiness, QA and test planning, Linux, system administration, JumpCloud, RBAC, Google Workspace Administration

Data & Automation: SQL, Python, PostgreSQL, MongoDB, Snowflake, Redis, ETL/ELT, Prefect, data quality, data validation, REST APIs, Postman, JavaScript, Bash, Git, Retool, Metabase

Cloud & Infrastructure: AWS, Terraform, Infrastructure as Code, Docker, Kubernetes, EKS, CI/CD, GitHub Actions, OIDC, Prometheus, Grafana

PROFESSIONAL EXPERIENCE

TechOps Team Lead · YuviTal

2024 - 2026

- Led technical operations for a production environment serving more than 2M users, staying hands-on with the systems, pipelines and databases behind it.
- Designed and built log-based monitoring and automated alerting across production services, pipelines and data flows, moving issue detection from next-day discovery to real time.
- Owned production incident investigation and resolution, from root cause analysis through follow-up monitoring and validation.
- Owned release management and release readiness - coordinating validation, verifying backend and database behavior before release, and validating post-release behavior and defects.
- Built an automated data-quality framework in SQL and Python across Prefect-orchestrated production pipelines supporting more than 100 production tables, reducing production data incidents by more than 30%.
- Led a three-person technical team of one developer and two TechOps engineers, mentoring while continuing to take on production work directly.

TechOps Engineer · YuviTal

2023 - 2024

- Investigated production issues and defects through SQL and NoSQL queries, logs and API testing, tracking them in Jira and working with developers through to resolution.
- Ran backend and database testing across production data systems including PostgreSQL, MongoDB, Snowflake and Redis.
- Validated ETL runs and data flows, and API-based integrations with request and response verification in Postman.
- Operated production and staging systems day to day, including data cleansing and debugging scheduled and background jobs.
- Investigated fraud and abuse patterns in production data and contributed to the hardening that followed, reducing abuse activity by approximately 15%.

ENGINEERING PROJECTS

NameGen: AWS & Kubernetes Delivery Lifecycle

github.com/ido-hail/namegen-final-devops-project

An existing open-source application by Bob Reselman, used under its MIT license. The infrastructure, delivery, observability and lifecycle work is mine.

- Terraform-provisioned AWS and EKS infrastructure with a private ECR repository, delivered through GitHub Actions using short-lived OIDC credentials, with no static AWS keys in the pipeline and images tagged by Git commit SHA with the ECR digest verified before deploy.
- Deployment verified rather than assumed: replica counts, bound PersistentVolumeClaim, encrypted EBS, load balancer and API checks, and a deliberate database Pod deletion confirming persistence. Prometheus and Grafana for monitoring, and a teardown that audits AWS resources and confirms nothing is left behind.

Pac-Man: DevSecOps Delivery Pipeline

github.com/ido-hail/pacman-project

A supplied open-source application. The pipeline, runtime configuration and security controls are mine.

- Trivy as a blocking gate on fixable HIGH and CRITICAL findings, non-root workloads with Linux capabilities dropped, and a Kubernetes NetworkPolicy limiting MongoDB access on TCP 27017 to the application Pods.
- Pull requests run the full validation path without deploying; deployment happens only on push to main, through an OIDC trust scoped to one repository and one namespace.

Portfolio Website · idohail.com

Static Astro site on Cloudflare Workers, built once per commit and served under a Content-Security-Policy derived from the build's actual contents.

PROFESSIONAL TRAINING

DevSecOps Program · Analiza Education Center · 2026 · 360 hours

Cyber Security Program · See Security College · 2021 - 2022 · 450 hours
